INFLUENCE OF NEUTRON FLUX DISPERSION IN RBMK CELL ON VALUE OF FUEL MAXIMAL AND AVERAGE TEMPERATURE

Engineering estimate of influence of azimuthal irregularity of energy-release field in fuel pellet of RBMK fuel element on value of fuel maximal and average temperature has been carried out. It is shown that neglect of this factor results in systematic underrating of estimated value of fuel maximal temperature by several tens of degrees.

HEAT PIPE TEMPERATURE FIELD AT CAPILLARY STRUCTURE PARTIAL DRAINAGE

The problem of determining temperature field in heat pipe cross-section at its emergency operation has been solved. It is ascertained that drainage of a half of surface of heat pipe capillary structure results in significant temperature growth in all characteristic points. This change is not significant and does not result in unacceptable temperature values. It is shown that at emergency operation heat pipe possesses self-stabilization property.

NUMERICAL ESTIMATE OF TEMPERATURE MEASUREMENT ERROR AT LOCAL IMPERFECT CONTACT OF THERMOCOUPLE AND MATERIAL

The results of numerical simulation of temperature fields in thermocouple at its ideal contact with material and at air gap at any junction border have been given. Air gap influence on accuracy of determining material temperature by thermocouple was estimated.

MATHEMATICAL SIMULATION OF BACTERIAL POLLUTION PROCESSES OF THERMAL STATION PROCESS BASINS

The results of mathematical simulation of hydrodynamics, heat exchange and phytoplankton occurrence in typical basin-cooler of thermal station in different seasons have been given. Mixed convection modes and phytoplankton photosynthetic property in open basin for different thermal periods were studied. Distribution of hydrodynamic parameters, temperatures were obtained and phytoplankton photosynthetic property in TS basin-cooler in different seasons was determined. It was ascertained that flow structure in different seasons does not change significantly and in open basin-cooler bioplankton photosynthetic activity is considerable even in winter for water pollution to the level exceeding the acceptable one.

CONTROL OF TEMPERATURE FIELDS OF DISTRIBUTED PARAMETERS OBJECTS

Nonlinear temperature field control system has been studied. Process of temperature field formation under the influence of thermal sources which are turned on by relay elements was examined. Influence of sources depending on their coordinates and turn-on time was analyzed. Estimate of temperature deviation from set value was given. The technique of estimating sampling increment of distributed control action was proposed. The investigation was carried out on the basis of Green function approach.

THERMAL CHARACTERISTICS OF LOCAL FUELS IN TOMSK REGION

Topicality of involvement of local low grade fuels into energy balance has been shown and local fuel characteristics: peat, wood, brown coal have been studied. Semi-coke obtained of original fuels are examined in view of their potential energy use. In this connection the given thermal characteristics may be used as original data for designing fuel-firing arrangements and manufacturing process calculation.

Aristov A.V., Payuk L.A.**CONTROL OF TRANSIENT PROCESSES IN ELECTRICAL
MACHINES OF PERIODIC MOTION**

Questions of controlling transient processes in two-way feed electrical machines operating in forced-oscillation regime have been examined. Interaction of two-way feed machine parameters with dynamic indices is ascertained, references on decreasing impact torques and currents due to selection of initial phases of supply voltages or values of coefficients of secondary element winding signal are given.

UDC 621.313.33

Aristov A.V., Voronina N.A.**PERFORMANCE CHARACTERISTICS OF OSCILLATORY MO-
TION ELECTRICAL DRIVE IN NONUNIFORM MOTION REGIME**

Analytic expressions determining frequency, mechanical and adjusting characteristics of oscillatory motion electric drive operating in single-step mode have been obtained. Noninteraction conditions as well as conditions of proportional control of kinematic and power characteristics of electric drive were determined by the coordinate, rate and moment.

UDC 621.313.333.2

Girnik A.S., Rapoport O.L.**MATHEMATICAL SIMULATION OF OPERATION
OF THREE-PHASE SUPPORTING ELECTRICAL MACHINES
ON ELECTRIC LOCOMOTIVE 2ES5K IN CONDITIONS
OF ASYMMETRICAL SUPPLY**

Influence of asymmetry and harmonics of supplying voltage on auxiliary motor operation has been considered. Influence of rotor winding sealing quality on machine overheating was shown. The conclusions of necessity of improving electric supply condition of such assemblies were drawn. Voltage unbalance factor and supply harmonic level should be rather lower – 2 and 19 % respectively.

UDC 621.313.3

Gusev V.V., Muravlev O.P., Shevchuk V.P.**SYSTEM ANALYSIS OF EFFICIENCY OF ELECTRIC MACHINE
FUNCTIONING IN MINING COMPLEX**

Methodology allowing estimating and supporting efficiency of electric machine functioning from point of view of system analysis has been given. The aim was desegregated to components which are reflected in the form of objective tree that allows studying the structure of supporting efficiency of electric machine maintenance and service. On the basis of expert estimation the relative humidity coefficients of objective tree components were determined

STUDYING OF THE INFLUENCE OF CABLE STEEL ARMOR ON
CHANGE OF MECHANICAL PROPERTIES OF PLASTICIZED
PVC AT THERMAL AGEING

Change of mechanical properties of cable polyvinyl chloride plasticate at thermal aging on sheath samples of cable KVVG, KVBBShv, AKVVG and AKVBbShv have been experimentally investigated. It is shown that presence of steel armor in cable construction results in acceleration of degradation of plasticate mechanical properties. Mechanism describing the process of plasticate aging at armor presence was proposed. It consists of two stages: plasticizer and water steam condensation on armor bands with further embrittlement of sheath inner surface, cracks formation and propagation.

AMPLITUDE-PHASE LASER BEAM CONTROL.
P.1. AMPLITUDE DISTRIBUTION FORMATION

Algorithm of forming the required distribution of laser radiation amplitude at its phase control has been given; estimates of algorithm accuracy in amplitude formation problem passed the extended layer of distorting medium have been carried out. Possibility of implementation of amplitude-phase correction of atmospheric distortions in an adaptive system including two deformable mirrors was examined.

UDC 535.211

Kanev F.Yu., Makenova N.A., Khokhlova T.E., Tsyro E.A.
AMPLITUDE-PHASE CONTROL OF LASER BEAM.
P.2. DEPENDENCE OF CONTROL EFFICIENCY
ON SYSTEM PERFORMANCE

Estimates of efficiency of using gain-phase control of laser beam for compensation of thermal and turbulent radiation distortions have

been obtained in numerical experiments. Adaptive systems operating on the basis of wave front conjugation algorithm with systems of phase conjugation were compared. It is shown that at insignificant control performance the quality of distortion compensation decreases. Requirements to system performance may be reduced at deflection of supporting radiation propagating channel to the side opposite to flow direction in the medium (to the windward side).

COAXIAL REFLECTING TRIODE
WITH RADIAL DIVERGENT BEAM

Steady state of electron flow and formation of virtual cathode in coaxial reflecting triode with radial divergent beam in a wide range of accelerating voltages have been considered. Virtual cathode formation was simulated by particle-in-cell method. The dependence of exciting oscillations increment and, therefore, radiation efficiency on diode geometry, external voltage and resonant chamber impedance was obtained. It is shown that in coaxial triode the largest beam interaction increment occurs with the wave of TEM type. The region of geometrical dimensions of coaxial system where the most efficient excitation of electromagnet oscillations on TEM mode may be carried out was determined.

COAXIAL CAVITIES IN COMPRESSORS
OF MICROWAVE PULSES

Operation of coaxial microwave compressors has been analyzed. Their principle of operation is based on resonant amplification of electromagnetic field with further rapid energy extraction in the form of powerful nanosecond microwave pulses. Compressor is switched from accumulation mode to energy extraction mode by microwave discharge allowed in capacitive gap in central conductor of coaxial resonator. It is shown experimentally that in meter and 30-cm wavelength range such compressors allow obtaining radio pulses with duration up to 2–3 periods of high-frequency field. The results of investigation of compressor operation with maximal frequency of pulse repetition are given. At gas blasting in discharge gap the compressor may operate with passing frequency to 20 kHz.
