LINEAR SYSTEM UNDER THE INFLUENCE OF ACCIDENTAL SLOWLY CHANGING IMPULSES

Arbitrary linear system under the influence of external chaotic impulses is considered. It is suggested that the external pulse transmission to the system is described by some quadratically integrated function. It is shown that suggested assumptions imply correct definition of a stochastic integral.

FORMATION CONDITIONS OF MAJOR AND GIANT GOLD FIELDS

Regulations on major and giant endogen gold fields (and complex gold and platinum objects) in active phenomena of plumbtectonics, paleodiapirism, riftogenesis, mantle and crustal metasomatism are established. It is shown that intra-mantle metasomatism leads to redistribution and production of noble metals from deep-seated dunites and peridotites subject to volumetrical amphibolization under the influence of heated fluids. Intra-mantle magma and thermal fluids dynamic noble metals bearing systems provided the formation of major and giant ore objects in the earth's crust. In the absence of penetration features of deep-seated fluxes and thermal fluids flows into the crustal ore localization areas only fields with poor and average content of metals can be formed.

SAMPLING FORMATION DURING THE CALCULATION OF STATISTIC PARAMETERS OF CHEMICAL ELEMENTS DISTRIBUTION AND BALANCE IN THE WALL ROCK AREA OF HYDROTHERMAL GOLD DEPOSITS

The paper reveals contradictory opinions concerning the estimation of abnormal gold concentrations in wall rock area of gold fields located in hydrocarbon shale formations and methods of their avoidance. The major attention is drawn to the necessity of geochemical samples formation taking into account the content and origin of parental rocks, metamorphic and metasomatic zone sequence. This provides the opportunity to reconstruct the geochemical metal history in wall rock area, create unified formation system of geochemical database at both regional and global levels, and solutions to other complicated tasks. The efficiency of suggested formation principles of geochemical samples is shown using the example of ore-hosting shale part of Northern Transbaikalia Karalonsky ore field. In particular, the formation of wall rock geochemical envelope with low (near-clarke) gold content and a number of its accompanying metals in a parental sedimentary rock of sandy silt size, subject to regional greenschist facies metamorphism, is proved. Conclusions concerning external sources of ore and aureole gold and other metals are made.

FORMATION MECHANISM OF ABNORMAL STRUCTURES OF GEOCHEMICAL FIELDS OF HYDROTHERMAL GOLD DEPOSITS

Existing concepts of zoning sequence appearance in hydrothermal ore and metasomatic systems are considered. The major attention is drawn to controversial physical and hydrodynamic aspects of their formation. The author's opinion on the formation mechanism of zoning abnormal structures of geochemical fields is presented. Origin and functioning hypothesis of hydrosulphuric barrier in hydrothermal deposits is suggested.

COMPOSITION AND PECULIARITIES OF GAS DISTRIBUTION IN QUARTZES OF KALGUTINSKOYE RARE-METAL FIELD

Basic components of gas-liquid inclusions in quartzes of ore-bearing geological formations of Kalgutinskoye rare-metal field are investigated, among which there is H₂O, CO₂, CO, H₂, as well as saturated (CH₄, C₂H₆, C₃H₈, C₄H₁₀, C₅H₁₂, C₆H₁₄) and unsaturated hydrocarbons (C₂H₂, C₂H₄). H₂O and CO₂ are major inclusion components. There is a domineering number of two-phase inclusions, while one- and three-phase inclusions are rarely identified. Homogenization temperature of primary inclusions is 290...340°C, and 140...160 °C in secondary ones. The concentration of saline solutions (NaCl) in the content of two-phase authigenic inclusions amounts to 11,6...14,0 mass per cent. Ore-bearing field formations strongly differ in general gas content. Common peculiarities of zoning distribution of components are determined. H₂O and CO₂ content decreases with depth but the content of CO, H₂ and hydrocarbons increases; concentration of carbon dioxide and hydrocarbons in fluid content increases. Regular formation of earlier defined graphite due to carbon yield from a fluid is shown. The conclusions concerning mineralization in contrast oxidation conditions of primary restored metal-bearing fluid are made.

THE NATURE OF IVANOVSKIY ASPHALTITE OCCURRING IN ORENBURG REGION

Elemental, functional and group compositions of the asphaltite recovered from Ivanovskiy field, as well as molecular compositions of hydrocarbon and heteroatomic components in asphaltite oil fraction are studied. The results obtained allow one to conclude that crude oil generated at earlier stages of catagenesis by marine carbonate or marine/mixed carbonate, deposited in anoxic/sulphide environment is the source material for the formation of asphaltite deposit. Early diagenesis of the sediment proceeded under highly reduced conditions. Amides of saturated and unsaturated acids are identified in native bitumen composition for the first time.

V.V. Peshev**INFLUENCE OF NON-HOMOGENEOUS ELECTRICAL FIELDS ON DLTS SPECTRA IN NEUTRON-IRRADIATED SEMICONDUCTORS**

The expression for DLTS spectra in semiconductors containing inner electric fields is obtained. With the use of this expression, an attempt is made to connect the U-band origin in DLTS spectra of a neutron-irradiated n-GaAs with well-known P2 and P3 defects within disordered regions. Shape and temperature position of P2 and P3 peaks in DLTS spectra are supposed to change due to disordered regions electric field influence on electron rates during emission from these traps. The numerical calculations of DLTS spectra for P2 and P3 centers are fulfilled and satisfactory agreement with the experimental data is observed.

UDC 537.533.2

E.P. Surovoy, I.V. Titov, L.N. Bugerko**CONTACT POTENTIAL DIFFERENCE FOR LEAD, SILVER AND THALLIUM AZIDES**

Contact potential difference between metals, semiconductors, lead, silver and thallium azides (of different synthesis methods) and platinum reference electrode in a wide range of pressures

($1,3 \cdot 10^5 \dots 1 \cdot 10^{-5}$ Pa) and temperatures (290...400 K) is measured. Values of surface potentials are spotted. It is found that changes in contact potentials difference which are observed under decrease in pressure and increase in temperature of preliminary thermal treatment occur due to desorption of donor gas molecules from the surface of lead azide and due to desorption of acceptor gas molecules of silver and thallium azides and, as a result, due to the reduction of the surface potential to the minimum value. It is shown, that solid products of photolysis and thermolysis of azides are metals.

DYNAMIC RATIONALITY IN THE CONTEXT OF MODERN CULTURE AND SCIENCE

In this paper, the new interpretation of rationality is proposed. Traditional normative approach, mostly connected with science, doesn't meet the requirements of modern culture. Problem of rationality must be solved on the basis of the features of reality. One of its peculiarities is communicativeness. Communication is a perpetual dialogue between a man and a world, while rationality is the measure of their mutual accordance. However, the world of modern culture is variable and dynamic; this causes the dynamic nature of rationality. Its main features are communicativeness, self-reflection and situational character. Complementarity manifests itself both in cognition and in reality. It accentuates the ambiguity and dialogical character of cognitive process. As for the self-reflection and situativity, they resist to absolutization of any forms of mind placing the rationality into historical context and making it realize its own limits.
